W. Liao, R. Peng, X. Hu, Y. Zhang, W. Zhou, X. Fu, et al., GEOPHYSICS 2025 Vol. 90 Issue 2 Pages F11-F25, DOI: 10.1190/geo2023-0613.1

The innovative architecture of our Extended Fourier DeepONet (EFDO) neural operator network, combining the power of Fourier transforms with DeepONet for superior performance in geophysical modeling.

1. **6** Why EFDO?

EFDO is a cutting-edge neural operator network designed specifically for geophysical modeling tasks. It combines the efficiency of Fourier transforms with the flexibility of DeepONet architecture, offering:

- Better accuracy
- & Robust performance
- Enhanced generalization

2. Hardware Requirements

Before you dive in, make sure you have:

- M NVIDIA GPU (compute capability ≥ 6.0)
- PGPU Memory: 16GB minimum (24GB recommended)
- § System Memory: 64GB minimum (256GB recommended)
- S Disk Space: 50GB minimum (512GB recommended)

3. Software Requirements

You'll need these tools in your arsenal:

- \bigcirc Ubuntu ≥ 18.04 LTS (or Windows ≥ 10 with WSL2)
- \mathbf{Q} Python ≥ 3.7
- OPyTorch ≥ 1.8.0
- Essential packages:
 - torchinfo
 - yaml
 - numpy
 - scipy
 - pandas
 - matplotlib
 - jupyter notebook

4. X Installation

Pro tip: We recommend using Anaconda with Mamba for lightning-fast package installation!

4.1 Step 1: Get Mamba Up and Running

First, grab Mamba from the Mambaforge download page:

```
bash Miniforge3-Linux-x86_64.sh -b -p ${HOME}/miniforge
```

4.2 Step 2: Set Up Your Environment

Add these magic lines to your \(\backslash \). bashrc:

```
# conda
if [ -f "${HOME}/miniforge/etc/profile.d/conda.sh" ]; then
source "${HOME}/miniforge/etc/profile.d/conda.sh"
fi
# mamba
if [ -f "${HOME}/miniforge/etc/profile.d/mamba.sh" ]; then
source "${HOME}/miniforge/etc/profile.d/mamba.sh"
fi
alias conda=mamba
```

4.3 Step 3: Create Your EFDO Environment

```
conda create -n efdo python=3.8
conda activate efdo
```

4.4 Step 4: Install Dependencies

```
# Install PyTorch with CUDA support
conda install pytorch torchvision torchaudio pytorch-cuda=11.7 -c pytorch -c nvidia
# Install other required packages
conda install torchinfo pyyaml numpy scipy pandas matplotlib jupyter notebook
pip install ray
```

4.5 Step 5: Get the Code

```
git clone https://github.com/CUG-EMI/EFDO
```

5. Dataset Generation

5.1 Option 1: Python Method

Quick and parallel dataset generation:

```
python model_gen.py 100 50 train_gen
```

- 100: Number of datasets
- [50]: Parallel processes
- train_gen: Output filename

5.2 Option 2: Julia Method

julia juliaCallGRF.jl

In this command, the generated datasets will be saved in the data directory. But it is worth noting that the julia code only generates the Gaussian random field models, and you need to calculate the forward modeling results using other forward modeling codes. In this research, we use our own MT2D julia forward modeling code to calculate the forward modeling results. And the forward modeling code is not open source.

Note: For Julia users, set up PyCall first:

```
1 ENV["PYTHON"] = "Path of the python environment"
2 using Pkg
3 Pkg.add("PyCall")
4 Pkg.build("PyCall")
```

5.3 **A** Important Note on Forward Modeling

The Python forward modeling code included in this repository (which is not our original work, for more details see <u>EFNO_GRF</u>) has some limitations and potential issues. Therefore, we recommend:

1. Use only the Gaussian random field part of this code to generate the conductivity models

- 2. Employ other well-established forward modeling codes to calculate the MT responses
- 3. This approach ensures more reliable and accurate dataset generation

This separation of model generation and forward computation allows for:

- Better quality control of the synthetic data
- More flexibility in choosing appropriate forward modeling algorithms
- Increased reliability of the training dataset

If you need recommendations for alternative forward modeling codes, please refer to established MT modeling software in the geophysical community.

5.4 **!** Pre-generated Datasets

Don't want to generate data? No problem! Download our pre-generated datasets from Google Drive datasets

6. Training Your Network

6.1 Configuration

Navigate to the code directory
 Edit config EFDO.yaml with your paths and parameters

6.2 Training Commands

```
# change to the code directory
cd code
# activate environment
conda activat efdo
# Train EFDO
python EFDO_main.py EFDO_config

# Train EFNO
python EFNO_main.py EFNO_config

# Train UFNO3d
python UFNO3d_main.py UFNO3d_config
```

6.3 🔬 Visualization and Analysis

Check out our Jupyter notebooks (*.ipynb) in the code directory for:

- Result visualization
- Performance analysis
- Model comparisons

6.4 **Pre-trained Models**

Get a head start with our pre-trained models from <u>Google Drive pre-trained models</u>, you can download them and put them in the <u>temp_model</u> directory, and then you can use the trained models in the <u>jupyter notebook</u> file to predict the forward responses.

Ready to revolutionize your geophysical modeling? Let's get started! 🖋

For questions and support, open an issue in our GitHub repository or contact our team.

EFDO Neural Network Visualization Guide

1. Fintroduction

Welcome to the visualization guide for the EFDO Neural Network! To help researchers in geophysics better understand and utilize our open-source neural operator network, we're excited to share all the plotting scripts used in our paper.

1.1 Data Visualization Tools

All figures in this study were created using Generic Mapping Tools (GMT). To promote broader adoption and understanding of GMT within the research community, we provide scripts in three different formats:

- **Traditional GMT Scripts**: For command-line interface enthusiasts
- **Q** PyGMT Scripts: For Python users seeking a more familiar syntax
- 🐈 Julia GMT Scripts: For Julia users preferring GMT functionality in Julia

Pro Tip: Choose the format that matches your programming style - they all produce identical, publication-quality results!

2. **©** Example: Reproducing Paper Figures

Let's take a look at one of our key figures and how you can reproduce it using any of the three supported approaches:

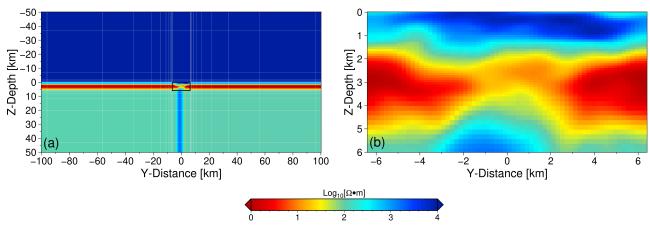

Figure: The discretization method of resistivity structures in MT forward modeling.

2.1 * Three Implementation Approaches

• GMT Script #!/usr/bin/env bash 2 function preset1() 3 4 ymin=-100000 5 ymax=100000 6 zmin=-50000 7 zmax=50000 8 scale=1000 9 ymin=`echo \$ymin \$scale | awk '{print (\$1/\$2)}'` ymax=`echo \$ymax \$scale | awk '{print (\$1/\$2)}'` 10 zmin=`echo \$zmin \$scale | awk '{print (\$1/\$2)}'` 11 12 zmax=`echo \$zmax \$scale | awk '{print (\$1/\$2)}'` echo \$ymin \$ymax \$zmin \$zmax 13 14 range_yz1=\$ymin/\$ymax/\$zmin/\$zmax 15 } preset1 16 17 gmt set FONT_ANNOT_PRIMARY 12p 18 gmt set FONT_LABEL 14p gmt set MAP FRAME PEN 1p,black 22 # x=0 slice gmt begin Figure5 pdf,png gmt makecpt -Cthermal.cpt -T0/4.0/0.01 -Z -H > rbow.cpt gmt grdconvert wholeRangeGrids.grd out.grd gmt grdedit out.grd -R\$range_yz1 -Gresult.nc 27 28 gmt basemap -Bxa20f10+l"Y-Distance [km]" -Bya10f5+l"Z-Depth [km]" -BWStr -R\$range_yz1 -JX12c/-6c 29 gmt grdimage -R\$range yz1 -JX12c/-6c result.nc -Crbow.cpt 30 # y grid lines 31 gmt plot -Wfaint,white line_y.txt -Frs 34 # z grid lines 35 gmt plot -Wfaint,white line_z.txt -Frs 36 37 # the core region gmt plot -W0.8p <<EOF 38 -6.4 0 39 -6.4 6.0 40 41 6.4 6.0 42 6.4 0 43 -6.4 0 44 EOF 45 gmt text -F+f16p,Helvetica << EOF</pre> 46 47 -93 43 (a) 48 **EOF** 49 50 function preset2()

42
        data1 = grdedit("wholeRangeGrids.grd", region=range_yz1)
43
        basemap!(region=range_yz1, figsize=(12, -6), frame=(axes=:WStr,),
                  xaxis=(annot=20, ticks=10, label=:"Y-Distance [km]"),
44
                  yaxis=(annot=10, ticks=5, label=:"Z-Depth [km]"),
45
46
                 par=(FONT_ANNOT_PRIMARY=12, FONT_LABEL=14, MAP_FRAME_PEN="1p,black",)
47
                 )
        grdimage!(data1, region=range_yz1, figsize=(12, -6), cmap="rbow.cpt")
48
        plot!("line_y.txt", pen=(0.1, :White))
49
50
        plot!("line_z.txt", pen=(0.1, :White))
51
        boxline = [-6.4 0;-6.4 6.0;6.4 6.0;6.4 0;-6.4 0]
        plot!(boxline, pen="0.8p", close=true)
52
53
        text!(["(a)"], font=16, x=-93, y=43)
54
55
        # Figure (b)
        data2 = grdedit("coreRangeGrids.grd", region=range_yz2)
56
57
        basemap!(region=range_yz2, figsize=(12, -6), frame=(axes=:WStr,),
                  xaxis=(annot=2, ticks=1, label=:"Y-Distance [km]"),
58
59
                  yaxis=(annot=1, ticks=1, label=:"Z-Depth [km]"),
                  par=(FONT_ANNOT_PRIMARY=12, FONT_LABEL=14,MAP_FRAME_PEN="1p,black",),
60
61
                 xshift=14
62
                 )
63
        grdimage!(data2, region=range_yz2, figsize=(12, -6), cmap="rbow.cpt")
        text!(["(b)"], font=16, x=-5.95, y=5.55)
64
65
        # Adding the colorbar
66
        gmtset(FONT_ANNOT_PRIMARY = "14p,Helvetica,black", FONT_LABEL = "14p,black")
67
        colorbar!(xaxis=(annot=1, ticks=0.2, label=:"Log@-10@-[@~W\267@~m]"),
68
69
                   pos=(paper=true, anchor=(-5,-2.5), size=(8,0.5), horizontal=true,
```

As you can see, each approach achieves the same result while catering to different programming preferences and workflows.

3. Setup and Installation

3.1 **(name of the second of th**

3.1.1 **1 GMT** and **PyGMT** Setup

We recommend using conda to create dedicated environments:

```
# Setting up GMT
   conda create -n gmt python=3.12
   conda activate gmt
   conda install -c conda-forge gmt
   # if `gmt --version` displays some error, please try the following way
   conda remove gdal sqlite
 7
   conda install -c conda-forge gmt gdal sqlite
8
   conda update gmt
   # Setting up PyGMT
   conda create -n pygmt python=3.12
11
12
    conda activate pygmt
   conda install numpy scipy pandas xarray netcdf4 packaging pygmt
```

3.1.2 2 Julia GMT Setup

For Julia users, it's just one line:

```
using Pkg
Pkg.add("GMT") # That's all!
```

PRecommendation: We suggest using the latest version of GMT in WSL2 with Ubuntu for the best experience!

4. M Usage Guide

4.1 II Using the Plotting Scripts

All figure scripts are located in the | Plotting_scripts | directory:

```
cd Plotting_scripts/Figure5
1
 2
    # For GMT users
   conda activate gmt
4
    bash Figure5.sh
6
   # For Python users
8
    conda activate pygmt
9
    python Figure5.py
10
   # For Julia users
11
    julia Figure5.jl
12
```

4.2 **I** Jupyter Notebook Support

We also provide Geophysics_plotting_scripts.ipynb which includes:

- Zode for all figures
- Q Detailed step-by-step explanations
- Interactive environment

5. Getting Help

- Visit the GMT official documentation
- Submit issues on GitHub
